Shaping the Future of Mobility with Innovation and Excellence

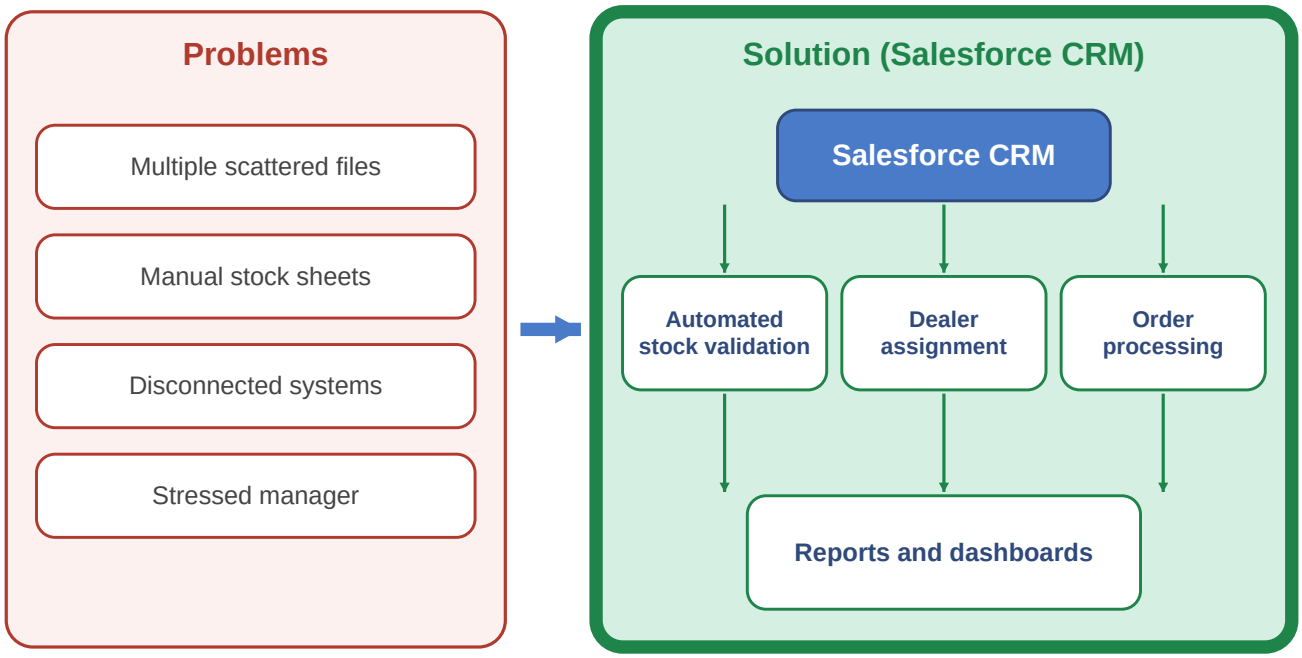
Project Design Phase - Problem-Solution Fit

4.1 Problem-Solution Fit

Overview

Problem-solution fit checks whether the proposed solution really solves the problems faced by the target users. At WhatNext Vision Motors, the problems identified in the ideation phase were scattered files, manual stock sheets and disconnected systems. The Salesforce CRM solution eliminates these fragmented operations by integrating **automated stock validation, dealer assignment and order processing** within a single platform.

Problem-Solution Fit: Vehicle Order CRM



Mapping Problems to Solutions

Problem	Impact	Salesforce Solution	Result
Multiple scattered files	Data is spread across registers and spreadsheets and is hard to find.	Vehicle, Dealer, Customer, Order, Test Drive and Service Request objects on one platform.	Centralized data.
Manual stock sheets	Wrong orders and stock errors.	Apex trigger validates stock; batch job updates orders and stock.	Accurate stock; no out-of-stock orders.

Problem	Impact	Salesforce Solution	Result
Disconnected systems	Delayed updates and manual follow-ups.	Flows assign the nearest dealer, update order status and send test drive reminders.	Faster, consistent processing.
Stressed manager	Complaints, delays and cancellations.	Automation plus reports and dashboards.	Less manual work and better visibility.

Fit with the Target Users

- **Operations Manager (PS-1):** No longer depends on manual stock information, because stock is validated and updated automatically.
- **Customer (PS-2):** Gets clear availability and timely updates, because order status and reminders are automated.
- **Dealers:** Receive orders matched to their location without manual coordination.

Conclusion

Every problem in the problem statements has a matching feature in the Salesforce solution, so the solution fits the problem well and gives a strong base for the proposed design.
