Shaping the Future of Mobility with Innovation and Excellence

Project Design Phase - Proposed Solution

4.2 Proposed Solution

Overview

The proposed solution replaces manual vehicle ordering with a Salesforce-based CRM. It automates the key steps of the ordering process: validating stock, assigning the nearest dealer, updating order status and reminding customers about test drives.

Proposed Solution Parameters

Parameter	Description	Explanation
Problem	Manual vehicle ordering	Orders, stock and dealer details are handled through registers and spreadsheets, causing delays and errors.
Solution	Salesforce CRM	A cloud CRM with custom objects, flows, Apex triggers, batch jobs, reports and dashboards.
Innovation	Automated dealer assignment	Each order is automatically linked to the dealer that matches the customer's location.
Impact	Faster service	Quicker order processing, fewer errors and timely communication improve customer satisfaction.
Business Model	Dealer network	The system supports a network of authorized dealers who receive and fulfil the orders.
Scalability	Multi-location support	More dealers, locations and vehicles can be added on the same platform.

How the Proposed Solution Works

1. Customer and vehicle details are stored in Salesforce objects.
2. A vehicle order is created with the status Pending.
3. The Apex trigger checks the stock and blocks the order if the vehicle is out of stock.
4. The Auto Assign Dealer flow links the order to the dealer matching the customer's location.
5. A scheduled batch job confirms pending orders when stock becomes available and updates stock.
6. The Test Drive Reminder flow emails the customer one day before the test drive.
7. Reports and dashboards show order status, dealer performance and sales metrics.

Expected Benefits

- Less manual intervention and fewer order errors.
- Real-time tracking of orders and stock.
- Better customer experience through timely updates and reminders.
- Higher operational efficiency for the operations team and dealers.
