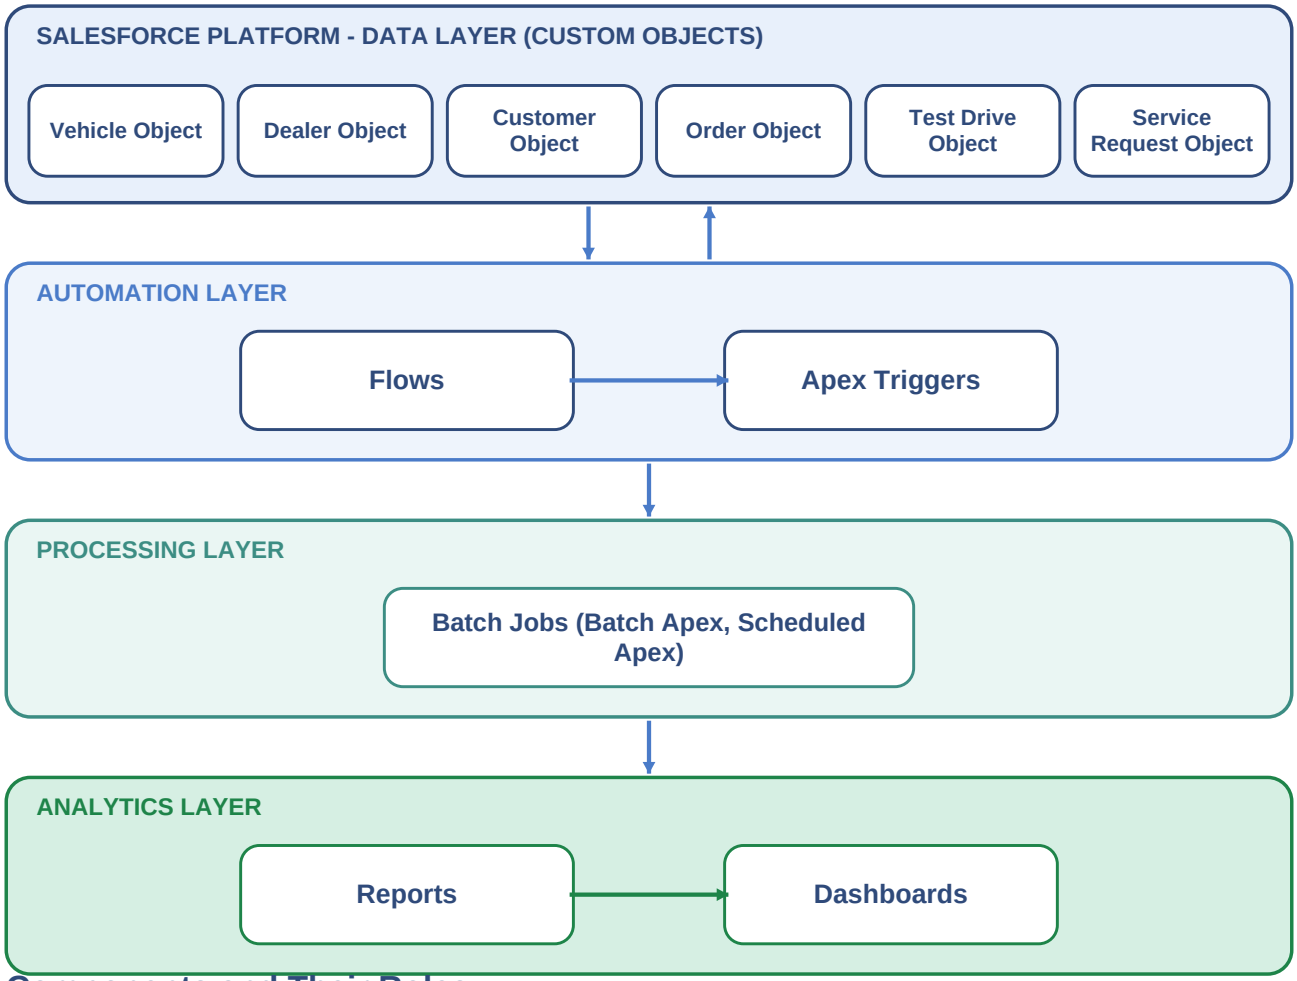
Project Design Phase - Solution Architecture

4.3 Solution Architecture

Overview

The solution architecture shows the components of the Vehicle Order and Dealer Management CRM and how they work together on the Salesforce platform. It is organized into four layers: data, automation, processing and analytics.

Architecture Diagram



Components and Their Roles

Component	Layer	Role
Vehicle Object	Data	Stores vehicle name, model, stock quantity, price, dealer and status.

Component	Layer	Role
Dealer Object	Data	Stores authorized dealer name, location, code, phone and email.
Customer Object	Data	Stores customer name, email, phone, address and preferred vehicle type.
Order Object	Data	Tracks vehicle purchases with customer, vehicle, date and status.
Test Drive Object	Data	Tracks test drive bookings and their status.
Service Request Object	Data	Tracks vehicle servicing requests.
Flows	Automation	Auto Assign Dealer and Test Drive Reminder flows.
Apex Triggers	Automation	Validate stock and update vehicle stock when orders are placed.
Batch Jobs	Processing	Confirm pending orders when stock is available; run on a schedule.
Reports	Analytics	Summarize order status, dealer performance and sales.
Dashboards	Analytics	Give managers a visual, real-time view of the reports.

How the Architecture Works

All business data is kept in the custom objects of the data layer. When an order is created, the automation layer (flows and Apex triggers) reads and updates these objects to validate stock and assign a dealer. The processing layer runs batch jobs on a schedule to confirm pending orders. Finally, the analytics layer reads the same data to present reports and dashboards, so managers always see current information.
